

**Find deleted photos on android phone**

**Continue**

How do i find deleted photos on my android phone. Where to find deleted photos in android. How to find deleted photos on my android phone.

Go to the Google Accounts page > People & Sharing > Contacts > Contacts > Menu > Trash. On Samsung, open Phone > Contacts > Menu > Manage Contacts > Import or Export Contacts. You may also use a software recovery tool on desktop. This article will walk you through restoring deleted or lost phone numbers on Android and Samsung devices. In most cases, you can recover the number and contact information if your new phone didn't sync properly or you accidentally deleted an important number. When you first set up Android, you must sign in with a Google account to use Google's apps and services, such as the Play Store. Your contacts are automatically backed up to your Google account, which means any lost or deleted phone numbers may still be available. If you haven't signed in to a Google account on your device at least once before, for whatever reason, this method will not be available to you. To recover deleted phone numbers or contacts, you need to use the Google Account Settings feature. This can be done on both a phone and a computer. On a computer or phone, go to the Google Accounts page. If you aren't already logged into the same Google account you use on your phone, make sure to do so. If you're logged into another account or a work account, you'll need to log out first. Using the menu at the top on mobile, or on the side on desktop, open People & Sharing. Scroll down to the Contacts section and open Contacts by tapping on the entry or clicking the Open button. You can also just go directly to Google Contacts. You will now see a list of all contacts saved to your Google account. Open the side menu and select Trash to recover any numbers you've recently deleted. You should now see a list of any deleted contacts, phone numbers, and email addresses. Each entry will detail where they were deleted from, such as the web or a specific device, as well as the date they were deleted. On mobile, tap the contact you wish to recover. Click if you're on a desktop. A menu will appear with options to Delete forever or Recover the contact. To recover, choose the appropriate option, and the details, including the phone number, will be restored to your contacts list. To check if the phone number has been restored, open the Phone app. Select Contacts and then search for the number or name of the contact you restored. Make sure you're opening the Google version. On some devices, you may have both the Google Phone app and a separate Contacts app. Samsung devices have both, for example. Remember, you can use the Google account management page (from Step 1) to back up your data, customize your privacy settings, manage payment methods or subscriptions, and much more. Although not as common, your phone may have contacts stored on the internal memory or a SIM card. It's possible to retrieve deleted numbers from those storage locations on your Samsung phone by using the import and export functions. Here's how to import contacts: Go to Contacts > Menu > Manage Contacts. Tap Import or export contacts and then import. If you have any contacts stored on your SIM card or your internal memory, you will see those sources in the list. Select the source you want to retrieve and then tap import to confirm. Wait for it to finish. You can use the export function to make a backup of your contacts. Yes, you can retrieve deleted numbers directly from your phone without using a computer, but it limits the methods you can use. You will have more opportunities if you have a computer available. For example, you can use recovery software on your computer to restore numbers, contacts, messages, photos, and much more. FAQ How can you move phone numbers from Android to iPhone? Apple has an official app called Move to iOS that can help you make the switch. It transfers all of your contacts, messages, photos, and more. How can you backup contacts on Android? Open the Settings app and select Google > Settings for Google apps > Google Contacts sync > Also sync device contacts > Automatically back up & sync device contacts. Tap the toggle to turn it on and choose which account you want contacts saved to. All current and future device contacts are automatically saved as Google contacts and sync to your Google account. How can you save contacts on your SIM card to your Google account? Google's automatic backup for contacts doesn't work on phone numbers saved to a SIM card. To back up your SIM contacts, you need to import them. While the SIM card is in your device, go to the Contacts app and select Menu > Settings > Import > SIM Card. Thanks for letting us know! Get the Latest Tech News Delivered Every Day Subscribe Tell us why! It's that time of year again when you're working your smartphone overtime attempting to keep up with all of the memories of holiday parties, family gatherings, and pets you've wrangled into festive attire. If you're working with any of the latest Android phones, including the Google Pixel 3 or Samsung Note9, then one of the best cameras on the market is already in your pocket. But regardless of the prowess of your high-end smartphone, merely pointing and shooting at the scene is not the way to capture lasting memories. The same rules apply to smartphone photography as they do studio photography: a little staging goes a long way. Take a beat before hitting the shutter button and employ one or more of the following tips to help make your smartphone-snapped photos look their best. Hold still: You've heard this before, but it bears repeating because it makes an incredible difference: make sure the camera is still when you're shooting a photo. I can't tell you how many times I've snapped and walked to keep up with a group or something of the sort, only to be disappointed later on by blurry results. Your Android phone may be fast at starting up the camera app (double-press the power button on most to instantly fire it up), but it can't make up the photo if you aren't still while taking it. It's always a good idea to get into the habit of checking on what you just snapped before moving on. You don't necessarily need a tripod in this day and age to take a still photo, though it certainly helps elicit the best results. My favorite is the dual-purpose Huawei Tripod Selfie Stick. There are also smartphone camera mounts for standard-sized tripods if you're already tricked out in camera gear. Alternately, specialized products like the Joby GripTight One GP Stand are great for capturing group photos. Leaning the phone against a wall or an object is also another trick of the trade when you're in a bind. G/O Media may get a commission. Don't be afraid to use an app: Android apps are indeed powerful enough to handle processing RAW photo files produced by DSLRs, so many of them can surely handle editing a photo taken by a smartphone. Free apps like Snapseed, Polarr, and Adobe Lightroom will appeal to tinkerers and those who consider themselves the "family photographer." For those who prefer the look of filtered photos, apps like VSCO offer over 100 kinds of millennial-colored flair, as well as A Color Story, which has some of the best filters for presenting to an Instagram audience. Both apps are free to use, though they offer in-app purchases to unlock some of the more popular aesthetics. If you'd rather not pay much to make your photos look aged, Kujicam is unapologetically fun to use, and your digital photos will look like they were taken in another decade. If you do mess up a picture and the moment has passed, try using an app like TouchRetouch to go in and remove an errant finger in the top corner. Don't forget the editing features your phone does natively. Google Photos comes pre-installed on nearly every flagship Android device and offers quick editing tools, including a handful of colored photo filters, a crop option, and the ability to edit common elements like the color hue and exposure. (Google Photos also offers automatic backup for your photos and videos, so be sure to take advantage of that, lest you lose all your precious memories the next time your smartphone drowns in a pool.) Samsung and LG's respective gallery apps also offer light editing options along the same lines. If you're feeling cheeky, you might even like some of the digital "stickers" bundled on Samsung's Galaxy and Note smartphones. A little light goes a long way! Like a little sultry lighting. A dozen candles and a few dimmed bulbs are the perfect way to signal to your guests that your abode is a cozy one. This kind of lighting is awful for pictures, however, and even though your phone's maker promised you some of the best low-light photos, lovely gatherings are not the place to test out this claim. Don't be afraid to incorporate a little bit of lighting when the scene calls for it. You don't need to buy anything extra; merely take off the top on a nearby lamp or other equivalent and place it in front of your subjects, beside you if you're the shooter. Also, avoid overhead lighting. As much as recessed lighting looks great in person, it's unflattering on camera. (There's a reason Mariah Carey wears sunglasses when she's indoors, where there's often overhead light.) The same grab-a-lamp trick helps diffuse these sorts of lighting situations and makes everyone in the photo look glowing and alive. Your smartphone's flash can do the same in a pinch, though avoid using it as your primary light source, as it can make your party look washed out. Alternatively, you can use a friend's smartphone flashlight as a directional light of sorts by shining it at the angle you want people's faces to be lit. It can contribute to some really neat lighting effects. Use "night mode" if you have it: Are you one of the lucky ones to get the Pixel 3's Night Sight update? Be sure you're using it when the situation calls for it, like inside restaurants or faintly-lit historical buildings. The feature is coming soon to older Pixel devices and is available in the default Android camera app, from the same screen where you can switch between panorama mode and the like. On Samsung and LG phones, a similar ability is buried in the "Pro" or "Manual" modes. In this case, you'll have to do a bit of tweaking to the camera settings to get the kind of photo you want. You don't have to be a camera pro to access this, as most manufacturers offer live previews so you can see what the result will look like after a bit of finagling. For best results, leave everything on Auto except for the shutter speed—that's where you'll see the real difference in how much light camera can take in. And of course, don't forget to lean it up against something while the shutter is open or you'll end up with a blurry photo. Use Portrait mode like it's the real deal: Portrait mode is one of those default standard features that now comes included with every flagship smartphone. It's like panorama mode, except that you're likely to use it more often because it gives pictures a bit of a high-tech look. You don't have to use it to snap photos of people, either. It works just as well for animals, plants, or any other curious object. My favorite thing to do with Portrait mode, whether I'm taking a selfie or snapping a photo with cousins I haven't seen in over a decade, is to use it against a simple backdrop. A blank wall is perfect for headshots, while a patterned wall adds a bit of flair. I love the faux "studio look" of these sorts of photos, and you can get creative by using the lamp-light trick in a living room. If done right, the result of your Portrait mode could look as preened and polished as if taken on school picture day, and they could even be photos worthy enough to slap onto a bundle of holiday cards in the next year. Keep it clean: Lastly—and indeed the most obvious piece of advice on the list here—don't forget to wipe your camera lens before taking a photo. Your smartphone is perfectly capable at this stage in the game to take a high-resolution picture of the people you love, but it won't matter if the glass is smudged up with face grease and other assorted debris. Even if you have a case on with a camera covering, wipe that part clean on the inside and out to ensure that your photos remain untainted. If your smartphone is your only camera, you should always carry either a microfiber cloth or a pack of screen-cleaning wipes. Buy them in bulk and place them everywhere: in every bag you use and every car you ride in. Pictures are only worth a thousand words if they're discernible, and if you spent upwards of this much on a new phone, then it should produce frame-worthy photos.
