Awarded the "Best Diagnostics Labs - Pathology Labs"

by Times Healthcare Achievers Tamil Nadu 2020.

TEST	UNITS	REF RANGE	REF UNIT	RESULT
WBC	cells/mm ³	4,500 - 11,000	cells/mm ³	12,500
Hb	g/dL	12.3 - 15.3	g/dL	14.5
Hct	%	35.9 - 44.6	%	42.5
MCV	fL	80 - 100	fL	95
MCH	pg	27 - 34	pg	30
MCHC	g/dL	32 - 36	g/dL	31.5
RDW	%	11.5 - 14.5	%	13.5
PLT	cells/mm ³	150,000 - 450,000	cells/mm ³	200,000
DIFF	%		%	
Neutrophils		50 - 70	%	65
Lymphocytes		20 - 40	%	25
Monocytes		2 - 10	%	8
Eosinophils		1 - 5	%	2
Basophils		0 - 2	%	1

Hematology lab report abbreviations. Hematology lab reporting worksheet. Hematology lab reporting worksheet university of phoenix. Hematology lab report sample. How to read a hematology lab report.

Revised Medically by Melinda Ratini, M.D., MS on February 14, 2020. Complete Hemogram, (CBC) is a test that counts the cells that compose your blood: red blood cells, white blood cells, and platelets. Your doctor may ask for a hemogram as part of a routine control or to see if you have anemia, a condition that causes you to have fewer red blood cells than normal. Symptoms of anemia include weakness, fatigue, and shortness of breath. A laboratory nurse or technician will collect a blood sample by placing a needle on a vein from your arm. After that, you can leave and return to your routine. They send the blood to a laboratory for revision. The test can say much to your doctor about your overall health. Measurements: White Blood Cells (Leukocytes). These help your body fight germs. If you have too many, it may be a sign of inflammation, infection, a medical reaction, or another problem of health. If it is low, it may be at greater risk of infection. A medication, a viral infection, or a disease of the bone marrow can also cause a low count of red blood cells (hemoglobin). These help transport oxygen to your body. Also they help to transport, carbon dioxide. If the hemoglobin count is too low, you can have anemia or other conditions. Hemoglobin (HB or HGB). This is the blood protein that contains oxygen. Hematocrit (HCT). This test tells how much of your blood is composed of red blood cells. A low scoring can be a sign that it has enough iron, the mineral that helps your body make red blood cells. A high score may mean that it is dehydrated or has another condition. Corpuscular volume (MCV), which is the average size of its red blood cells. If larger than normal, your MCV will be larger. This can happen if you have low levels of vitamin B12 or folate. If the red blood cells are smaller, you can have a type of anemia. Plates. This helps your blood clot. When you receive your report, you will see two columns: one for the reference interval and its results. If your results are within the reference interval, they are considered normal. If your results are larger or smaller than the reference interval, they are abnormal. Light anemia is one of the most common reasons your results may be out. Each laboratory has different ways of studying your blood. So the reference interval will depend on the laboratory that deals with blood tests. Also it is based on things that can affect your blood as your age, your sex and how high above the sea level you live. In general, reference ranges are: white blood cells: 4,500 to 11,000 cells per microliter (cells / μl) Red blood cells: 4.5 million to 5.9 million cells / μl MCV for men; 4.1 million to 5.1 million cells / μl for women hemoglobin: 14 to 17.5 grams per deciliter (GM / dL) for men; 12.3 to 15.3 gm / dL for women Hematocrit: 41.5% to 50.4% for men; 35.9% to 44.6% for women Corpuscular volume: 80 to 100 microliters plateslets can request more results to know if you have a disease or condition including: corpuscular hemoglobin (MCH). This test says how much hemoglobin is in your heavy-weight red blood cells. Concentration of corpuscular hemoglobin (MCHC). This measures the concentration of hemoglobin in a certain amount of blood. Distribution width of red cells (RDW). This shows how your red blood cells vary in size. Reticulocyte count. This test measures the number of new red blood cells in your body. Volume of platelet (MPV). This one gives the platelet size in your blood. Platelet distribution width (PDW). This shows how much your platelets vary in size. Differential of white blood cells. There are five types of white blood cells: eosinophils, lymphocytes, monocytes, and neutrophils. This test shows how many of each type you have. Hello! © 2020 WebMD, LLC, all rights reserved. View information on privacy policy and trust a blood test sometimes referred to as a blood panel is a laboratory examination of a blood sample used to verify a variety of things, including the functioning of certain bodies (such as the brain, kidneys, thyroid and heart), infections and certain genetic diseases to assess the general health of an individual. After the sample has been analyzed in the laboratory and the results compiled, in most cases a blood analysis report will be provided to the test. The report details the various blood components and what levels are present. For the no hands system of measurements and several abbreviations, including: mmHg - millimeters of mercury (femtomole): fraction of one millionth of a mole (picogram): one billionth of a gram (picogram): one billionth of a gram (picogram): one billionth of a gram (picogram) People worried about their health too often can use the free Ada application to perform an evaluation of symptoms. Components of blood analysis results An analysis of blood usually consisting of three main tests: a complete blood count, a metabolic panel and a lipid panel. Each test for different things, which can be understood by a detailed analysis of the results. Confused, yeah it is likely that the results of the three tests are not differentiated from each other and are instead listed under a large column, often labeled within each of them are several sub-tests, which together give a general picture of the health of an individual. Blood Count (CBC) Concentrates on three types of blood cells: White Blood Cells (WBCs), Red Blood Cells (RBCs) and Platelets. By measuring the volume of red blood cells, CBC allows a doctor to evaluate the general health of a subject, as well as the verification of underlying conditions such as leukemia and anemia. Subtests within the CBC are: White Blood Cell Count (WBC) also known as leukocytes, white blood cells are an important component of the body's immune system. A high white blood cell count may indicate the presence of infection, while a low count can point to various conditions, including HIV / AIDS and LUPUS. Read more about a white blood cell count » Count of differential white blood cells The laboratory tests the top five components of white blood cells and its proportion to each other. If the components are out of equilibrium, this can indicate an infection as well as a variety of multi-systemic conditions. Healthy proportions are as follows:
