Introduction

This teacher's resource provides a range of teaching and reference materials which have been developed to aid the teaching of the Cambridge International Examinations IGCSE® Computer Science syllabus (0478).

These resources support the *Cambridge IGCSE Computer Science* textbook (by Watson and Williams), which has been endorsed by Cambridge International Examinations.

Scheme of work

The scheme of work has been devised to follow a logical route through the new IGCSE® Computer Science textbook. Its aim is to complete the course by the end of the second term in the second year of study; this will then allow adequate time for revision and exam practice. It is assumed that students will have 3½ hours per week study time in this topic (total study time over 5 terms: 245 hours, comprising 145 hours for section 1 and 100 hours for section 2). To ensure a good balance, it is also assumed that sections 1 and 2 of the Cambridge syllabus will be taught side by side; the scheme of work will therefore assume 2 hours per week on section 1 of the syllabus (theory) and 1½ hours per week on section 2 of the syllabus (practical). Naturally this can be modified depending on resource availability and other factors.

The relevant chapter and pages in the textbook and the syllabus references are detailed, as well as activities from the textbook; additional lesson notes are also included.

Answers

Answers to the end-of-chapter questions and (where relevant) the activities in the textbook are provided.

Examination-style questions

The Paper 1 examination-style questions with answers will be especially useful for teachers. They are based on the chapters in section 1 of the textbook. Teachers can select questions or question parts to make their own tests, or use the questions as provided. In general the level of difficulty of a question increases as the students work their way through the question. For example, all students should be able to tackle part a (shown with a green dot ●); most students should be able to tackle part b (shown with an orange dot ●); and those students aiming for the top grades should be able to tackle part c (shown with a purple dot ●). Answers for all questions have been provided, using this same colour coding. Sometimes there is additional commentary on the answers.

Program files

The Python and Java program files are for use with the activities and end-of-chapter questions.

Additional content in the textbook

Whilst asymmetric encryption is not in the present syllabus it was included in the textbook for two reasons:

1 to give a more complete picture on how encryption works (since student discussions may involve ways of improving the security of data by this method)
2 it is helpful to include asymmetric encryption when studying security systems on the internet such as SSL and TLS.

How do i use a vlookup to find a match from another sheet. Vlookup names from another sheet. How do i vlookup match data from another sheet. Vlookup partial match from another sheet. Vlookup from another sheet examples. How to use vlookup to match data from another sheet. Use vlookup with match.

Media Platforms Design Team After a long hard day, nothing feels better than climbing into bed and cozying up to a fresh set of sheets. That's why we tested 85 sets to find the best ones to recommend in the current issue of Good Housekeeping. Since we know everyone has their favorite type, we broke them down into four categories: Sateen, Percale, Flannel, and Jersey. In addition to having a consumer panel evaluate the feel of all 85, we also put them through rigorous Lab testing. Here's what we looked for: Did they shrink? How do they look after washing? Did they pill? How strong are they? If they get a small rip, will they resist further tearing? Will the color rub off onto pj's or a comforter? After 5 washes, will they still be the same vibrant color? Will they fit on an oversized mattress? Can't wait to find out which were tops in our tests? Check them out in the March Good Housekeeping, on newsstands now. And when you're out shopping keep the following in mind: Before you go out shopping, measure the depth of your mattress. Then when you're in the store, before you buy a set, make sure they're a little larger to leave a little room for shrinkage. If you're very particular about your sheets forming pills, stay away from flannel or jersey as they're much more likely to pill than sateen or percale Wash sheets, especially flannel, a few times before you use them to get the extra lint out of them. If it's a new comforter you need, be sure to see our picks for the Best Down Comforters. Looking for environmentally friendly bed sheets? Take a look at Green and Gorgeous: Luxury Linens To see how we test products at the Good Housekeeping Research Institute, please go to www.goodhousekeeping.com/ghritours. This content is created and maintained by a third party, and imported onto this page to help users provide their email addresses. You may be able to find more information about this and similar content at piano.io Vlookup is a function which can be used to reference columns from the same sheet or we can use it to refer it from another worksheet or from another workbook, the reference sheet is same as the reference cell but the table array and index number are chosen from a different workbook or different worksheet. We all know the basics of the VLOOKUP functionThe VLOOKUP excel function searches for a particular value and returns a corresponding match based on a unique identifier. A unique identifier is uniquely associated with all the records of the database. For instance, employee ID, student roll number, customer contact number, seller email address, etc., are unique identifiers. read more in excel. Probably for beginners level, you must have practiced the formula from the same sheet itself. Fetching the data from another worksheet or from another workbook is slightly different using the VLOOKUP function in excel. Let us have a look at how to use VLOOKUP from another sheet and then how it can be used on another workbook. #1 – VLOOKUP from Another Sheet but Same Workbook Now copy the result table to another worksheet in the same workbook. In the Result, Sheet opens the VLOOKUP formula and select the lookup value as cell A2. Now the table array is on a different sheet. Select the Data Sheet. Now, look at the formula in the table array. It does not only contain table reference, but it contains the sheet name as well. Note: Here, we need not need to type the sheet name manually. As soon as the cell in the other worksheet is selected, it automatically shows you the sheet name along with the cell reference of that sheet. After selecting the range in the different worksheets, lock the range by typing the F4 key. Now you need not go back to the actual worksheet where you are applying the formula rather here itself. You can finish the formula. Enter the column reference number and range lookup type. We got the results from the other worksheet. #2 – VLOOKUP from Different Workbook We have seen how to fetch the data from a different worksheet in the same workbook. Now we will see how to fetch the data from a different workbook. I have two workbooks; one is Data Workbook & Result Workbook. From Data Workbook, I am fetching the data to Result Workbook. Step 1: Open the VLOOKUP function in the Result Workbook and select lookup value. Step 2: Now go to the main data workbook and select the table array. You can use Ctrl + Tab to switch between all the opened excel workbooks. The table array not only contains table range raththut it also, but it also contains Workbook Name, Worksheet Name, and data range in that workbook. We need to lock the table array here. Excel itself locked the table array automatically. Mention column index number and range lookup to get the result. Now close the main workbook and see the formula. It shows the path of the excel file we are referring to. It shows the complete file and subfile names. We got the results. Things to Remember About Excel Vlookup from Another Sheet (Same or Different Workbook) You can Download this Vlookup from Another Sheet or Workbook Excel template here – Vlookup from Another Sheet Excel Template. Recommended Articles This has been a guide to the VLOOKUP from Another Sheet or Workbook in Excel. Here we look at how to use VLOOKUP from a different sheet or workbook along with practical examples and downloadable excel templates. You may learn more about excel from the following articles – If your lookup value and lookup range are stored in different sheets of one Excel Workbook, you can use VLOOKUP without any problems. Here is what you should do. How to do vlookup in Excel with another sheet We imported a dataset from Google Sheets to Excel using Coupler.io, a solution for automatic data exports from multiple apps and sources. Read more about Microsoft Excel integrations for data export on a schedule. The data was imported to the sheet titled "dataset". In another sheet, titled "users", we have a list of users. The aim is to look up the cars that these users own. Here is what you need to do: Type =vlookup(in the B2 cellSpecify the lookup value. You can enter a string wrapped in quotes or reference a cell just like we did:Enter a comma/semicolon (depending on the list separator defined under your regional settings), click on the sheet with the dataset you want to look up and select the desired range.In the formula bar, add a comma/semicolon and enter the column number, which contains the matching value to return. In our case, the number is 4 (column D).=vlookup(A2,dataset!A2:F101,4 Add a comma/semicolon and enter FALSE to return the exact match. Close the bracket and hit enter=vlookup(A2,dataset!A2:F101,4,false) To return the matching values for other users, we can drag the formula down – but first we'll need to lock the table_range using the $ symbol as follows: =VLOOKUP(A2,dataset!$A$2:$F$101,4,false) Another option is to use an array formula. You need to specify an array as a lookup value=VLOOKUP(A2:A66,dataset!$A$2:$F$101,4,false) Then select an array where to return the matching values, insert the VLOOKUP formula into the formula bar and press Ctrl+Shift+Enter for Windows (Command+Return for Mac) Back to Blog If you know how to use VLOOKUP function to search for values in a worksheet, vlookup values from another worksheet or workbook won't be a problem for you. VLOOKUP values from another worksheet VLOOKUP values from another workbook VLOOKUP values from another worksheet This section is going to show you how to vlookup values from another worksheet in Excel. Generic formula =VLOOKUP(lookup_value,sheet_range,col_index,[range_lookup]) Arguments Lookup_value (required): The value you are searching for. It must be in the first column of the sheet_range. Sheet_range (required): A range of cells in a certain worksheet which contains two or more columns where the lookup value column and the result value column locating. Col_index (required): The specific column number (it is an integer) of the table_array, which you will return the matched value from. Range_lookup (optional): This is a logical value that determines whether this VLOOKUP function will return an exact match or an approximate match. Click to know more about the VLOOKUP function. In this case, I need to lookup values in the range B3:C14 of the worksheet named "Sales", and return the corresponding results in the Summary worksheet. 1. Select a blank cell in the Summary worksheet, copy the below formula into it and press the Enter key. =VLOOKUP($B5,Sales!B3:C14,2,0) Notes: B5 is the cell reference containing the value you are searching for; Sales is the sheet name you will lookup value from; B3:C14 is the range contains the matching value to return. In our case, the number is 4 (column D); 0 here means that the VLOOKUP function will return an exact match. If an exact match value can't be found, it will return a #N/A error value. 2. Then drag the Fill Handle down to get all results. VLOOKUP values from another workbook Assuming there is a wokbook name "Sales report", for directly lookup values in a specific sheet of this workbook even it is closed, please do as follows. Generic formula =VLOOKUP(lookup_value,[workbook]sheet!range,col_index,[range_lookup]) Arguments Lookup_value (required): The value you are searching for. It must be in the first column of the sheet_range. [workbook]sheet!range (required): The range of cells of a sheet in specific workbook, which contains two or more columns where the lookup value column and the result value column locating. Col_index (required): The specific column number (it is an integer) of the table_array, which you will return the matched value from. Range_lookup (optional): This is a logical value that determines whether this VLOOKUP function will return an exact match or an approximate match. 1. Select a blank cell, copy the below formula into it and press the Enter key. =VLOOKUP($B5,'[Sales report.xlsx]Sales'!B3:C14,2,0) Note: If an exact match value can't be found, The VLOOKUP function will return a #N/A error value. 2. Then drag the Fill Handle down to apply the formula to other cells to get all results. See screenshot: Related function The VLOOKUP function The Excel VLOOKUP function searches for a value by matching on the first column of a table and returns the corresponding value from a certain column in the same row.
